sensor, and to make the sensor as insensitive to temperature variations as possible. A commonly known method to make an imaging sensor insensitive to temperature variations is to employ "hot-film" thermometers. "Hot-film" thermometers use thermal sensors with small resistances (typically less than 100 ohms) to measure temperature. These small resistance thermometers are placed in contact with the temperature sensitive components of an imaging sensor. However, hot-film thermometers are difficult to manufacture and are costly, and therefore are typically not used in high volume, low cost applications. Another method for making an imaging sensor insensitive to temperature variations is to arrange the photodiodes and other sensor components in close proximity to heat generating components (e.g., where electric current travels through the chip) of the chip. This method enables the use of larger sized chips, and reduces the sensitivity of the sensor to temperature variations. A drawback of this method is that it can increase the area of the sensor. To reduce the area of the sensor, it is desirable to have a compact sensor. The proposed study will examine the growth and psychosocial functioning of children 595f342e71
