Photoshop has become one of the de facto tools for many image manipulations. The rise of digital cameras and digital imaging has led to greater use of Photoshop in general and the accompanying decline in the use of traditional film-based cameras in many instances. Photography is a tricky business, however, and a number of people continue to use their traditional film cameras with the intention of producing their own images. This chapter helps you achieve your creative and artistic goals. We also walk you through, step by step, how to use Photoshop to prepare images for publications and marketing. Our advice also includes the selection of Photoshop's most popular tools and settings. We explore common tasks you can perform to manipulate and alter images. Finally, we provide instructions on how to enhance text-based images so that they can be placed in a publication that is print-ready. Finding Help Photoshop is a complicated program, and the depth and breadth of the variety of tools, techniques, and things that can go wrong are daunting. It's your responsibility to investigate and learn as much as you can before you do any image manipulation. But Photoshop is a complex program, and even the most experienced users encounter problems from time to time. A number of books are devoted to Photoshop. We highly recommend these titles for both intermediate and advanced Photoshop users: *Photoshop* by Rick Meril (all editions), which we recommend as your main Photoshop resource. *Photoshop: The Missing Manual*, by Matthew Murray, which is one of the best books on Photoshop. A number of online tutorials are available to help you with basic, intermediate, and advanced Photoshop editing. We prefer to use the online tutorials that are affiliated with the most famous Photoshop programs because they are updated and kept up-to-date. We recommend the following two resources: * ` * ` The `Help` page on the Adobe website (shown in Figure 11-1) contains a large collection of Photoshop's most useful tips, tricks, and pitfalls, with many tutorials on the subjects that matter. Dante was “a top-level urban informant for many years,” said Tony Yarosh, chief of police in the city of Flint, MI. “He had a gun out the entire time we were investigating this thing.” Yarosh told reporters Dante was a member of the Gangster Disciples, a notorious, violent street gang in Flint. “When we started investigating he became our informant and gave us a lot of information about the guys who were members of these gangs,” he explained. Shortly after Dante’s arrest, Yarosh met with state police in Detroit to share Dante’s information, which led to the bust of the gang members at the three houses. “We’ve got a couple dozen guys who are members of the Gangster Disciples,” Yarosh said. “They call themselves a ‘dynasty’ because they’ve been in the game so long.” The police say the three houses were used to distribute drugs and act as a base of operation for the gang. Dante was the confidential informant who provided the information that led to the arrests, not the police who found and arrested the gang members at the three houses. A report released Tuesday by the Michigan State Police revealed that Dante led them to these locations, and he was therefore the actual investigator who found the drugs. “Obviously Mr. Dante was never in charge of investigating this case,” Lance Cpl. Joseph Shaw told me on Monday. “He played a very important role in the case. I mean, without him, we wouldn’t have been there.” Dante was very reluctant to talk to the press or even to reveal where he lived. He declined to comment on this story because he was “just a regular guy.” “The idea that something like this might happen to a person is something that really bothers me,” Dante said. “I’m not going to say my life is being ruined because I don’t want to seem like I’m complaining, but it’s just sad.” But Dante was not willing to sacrifice his life for this case. “If I start talking to them and let this get out, the last thing I want to do is end up like my friend,” he said. “When we started investigating he became our informant and gave us a lot of information about the guys who were members of these gangs.” Yarosh: L

1. Field of the Invention This invention relates generally to a method and apparatus for rapidly dissipating heat from electronic components, and more specifically to a method and apparatus for dissipating heat from packaged electronic components. 2. Related Art Electronic devices, including signal processing devices, transmit and/or receive electrical signals to and from other devices. Many of these electronic devices operate at a relatively high power level to achieve a faster speed of operation. Signal processing devices in particular often operate at high power levels and at high speeds. The higher power levels and high operating speeds result in the generation of more heat than is typically dissipated by the device. In particular, the higher the power level of the device, the greater the temperature of the semiconductor chips or die on which the signal processing device is built. Since the semiconductor chips or die are often formed of a semiconductor material, such as silicon, which has a relatively low thermal conductivity, there is a greater potential for the heat generated by the semiconductor chips to build up in the device. In addition, the semiconductor chips may not dissipate the heat as quickly as it is generated. This excess heat can damage the semiconductor chips or the device itself. Many electronic devices that perform signal processing typically operate under the supervision of a system controller that processes a digital signal that is transmitted to the device. As the bandwidth of the digital signal increases, the speed of the signal processing device is also increased. A typical signal processing device may, for example, operate at a maximum clock frequency of one gigahertz (1 GHz). At such high clock frequencies, the heat generated in the device can approach the point where additional cooling is required to maintain the device at an operating temperature which avoids any premature degradation of the device. As indicated above, many high speed electronic devices, such as those used in the communications and signal processing industries, operate at clock frequencies of one gigahertz (1 GHz) and above. For these devices, the effect of the heat generated by the device at such high frequencies can be greater than the capacity of the package to dissipate the heat. Other higher clock frequencies of, for example, two gigahertz (2 GHz), 3 GHz and the like, may be used for the particular signal processing device. In addition, it is not unusual for high speed electronic devices, such as signal processing devices, to be required to operate over a wide range of temperatures, from about zero degrees C. to about 130 degrees C., or higher
